The authors of this report wish to acknowledge extremely helpful assistance from economists William Hawk, Rudy Telles, Jr., and Mary Vansuch in the Office of the Chief Economist.

Introduction

The Small Business Administration (SBA) is responsible for implementing and administering the Women-Owned Small Business (WOSB)¹ Federal Contract Program, which went into effect on February 4, 2011. The purpose of the WOSB Program is to ensure that women-owned small business have an equal opportunity to participate in Federal contracting and to help attain the Federal government's goal of awarding five percent of its prime contract dollars to WOSBs.² The WOSB Program authorizes Federal contracting officers to restrict competition for an acquisition to WOSBs if there is "a reasonable expectation" that at least two WOSBs will submit offers that meet the requirements of the acquisition "at a fair and reasonable price" and if the acquisition is for a good or service in a North American Industry Classification System (NAICS) industry code in which SBA has determined that WOSBs are "substantially underrepresented." The Program also authorizes contracting officers to award sole source contracts to a WOSB if only one WOSB can be identified that can perform the contract at a fair and reasonable price. Prior to May 7, 2013, competitive contracts under the WOSB Program were capped at \$6.5 million for manufacturing contracts and \$4 million for all other contracts. SBA issued a rule effective May 7, 2013 that removed the caps on set-aside award size for which WOSBs and Economically Disadvantaged WOSBs (EDWOSBs) concerns are able to compete. EDWOSBs³ can receive set-asides similar to those described above for WOSBs but in a broader set of industries where SBA has determined that WOSBs are "underrepresented" but not substantially so.

The five percent goal has never been attained (see figure 1), although the share of dollars awarded to WOSBs rose from 3.2 percent in FY 2005 to 4.0 percent in FY 2010 where it remained through FY 2012. The share increased sharply to 4.3 percent in FY 2013 and 4.7 percent in 2014.

¹ A WOSB is a small (as defined by SBA) business that is at least 51 percent owned and controlled by one or more women.

² See 13 CFR 127.100.

³ EDWOSBs are WOSBs that are controlled by one or more women who are citizens and who are economically disadvantaged in accordance with SBA regulations.

Table 1 shows the breakdown of dollars obligated under contracts awarded to WOSBs and all firms (including WOSBs) in fiscal years 2012 through 2014. About 62-64 percent of dollars obligated under contracts to WOSBs were under various set aside programs, compared to about 13-15 percent for all firms. Roughly 56-58 percent of net dollars obligated to WOSBs was accounted for by small business set asides and the 8(a) business development program, compared to about 11-13 percent for all firms. Net dollars obligated under the WOSB program accounted for a small share for WOSBs (\$71 million or 0.4 percent in FY 2012, the first full year the WOSB program was in effect) but grew rapidly since then (to \$179 million or roughly one percent in FY 2014, of which \$72 million went to Economically Disadvantaged WOSBs and \$107 million to other WOSBs).

Memo: Total Under WOSB Program	71	0.4%	71	0.0%	100	0.7%	100	0.0%	179	1.0%	179	0.0%
Memo: WOSB share of total dollars	4.0031%				4.3231%				4.6826%			

Note: "Small Business Set Asides" predominantly consists of net dollars obligated exclusively (as opposed to "partial" set asides) under the Small Business set aside program plus much smaller amounts under the Emerging Small Business and several other largely phased out small business set aside programs. "Other" includes net dollars obligated under the Buy Indian, Historically Black Colleges and Universities/Minority Institution, and Small Disadvantaged Business set aside programs. Sums may not be exact due to rounding.

Source: Federal Procurement Data System

Currently, SBA's designation of industries with underrepresentation or substantial underrepresentation of WOSBs is based on an analysis performed by the RAND Corporation that was published in a 2007 report.⁴ In 2015, SBA asked the Office of the Chief Economist (OCE) of the U.S. Department of Commerce (DOC)⁵ for assistance in conducting a new study on the WOSB Program, as required by statute, which would analyze data to help SBA determine those NAICS codes in which WOSBs are underrepresented and substantially underrepresented in Federal contracting. As discussed in more detail below, OCE looked at whether, holding constant various factors that might influence the award of a contract, the odds of winning Federal prime contracts by firms that were owned by women were greater or less than the odds of winning contracts by otherwise similar businesses.

Overview of Results

Overall we find (as demonstrated in Table 5) that the odds of winning a contract for Woman-Owned Businesses (WOBs) are estimated to be roughly 21 percent lower relative to the odds of winning contracts by otherwise similar firms that were not identified as WOBS. In our analysis, we control for

⁴ Reardon, Elaine, Nancy Nicosia, and Nancy Y. Moore. *The Utilization of Women-Owned Small Businesses in Federal Contracting*. The RAND Corporation. 2007.

(http://www.rand.org/content/dam/rand/pubs/technical_reports/2007/RAND_TR442.pdf)

⁵ OCE is located in the Economics and Statistics Administration of the U.S. Department of Commerce.

the size and age of the firm; its membership in various categories of firms for which the Federal government has government-wide prime contracting goals; its legal form of organization; its level of government security clearance; and its Federal prime contracting past performance ratings.

We also looked at whether WOBs typically have significantly different experiences in winning contracts depending on their industry. We performed this analysis at the four-digit NAICS industry group level⁶, including each firm in our sample in an industry analysis if the firm had registered as being able to perform work in that industry or if the firm had won a contract assigned to that industry.

The industry-specific results on the odds of winning contracts vary considerably. We find (see Table 6) that in 109 industries (36 percent of the total) WOBs have statistically significant⁷ lower odds of winning contracts, covering 62 percent of contracts and nearly two-thirds of dollars obligated under contracts awarded in FY 2013 or 2014. In an additional 145 (48 percent) of the 304 industries included in our study the odds of WOBs winning contracts were lower than those of otherwise similar non-WOBs but in these cases there is not a statistically significant difference between the odds of winning contracts for the two groups. Overall, the industries in which WOBs are less likely to win contracts account for about 85 percent of contracts and of dollars obligated in Fiscal Years 2013-2014 (which is the period in which our data originated). WOBs have *greater* odds (none statistically significant) of winning contracts than otherwise similar non-WOBs in only 16 percent of industries.

Data

The goal of this report is to look at contracting outcomes among WOBs compared to other firms. In order to do this, we constructed a database of firms that might reasonably have been expected to be ready, willing and able to compete for Federal contracts, along with information on which of these firms actually won contract awards, over FY 2013-2014 (that is, the two year period from October 1, 2012 through September 30, 2014). In this database, we also have information on firm characteristics (such as size and age) as well as information identifying which firms belong to certain groups (in addition to ownership by women) for which the federal government has government-wide prime contracting goals. We also obtained information on past performance ratings of firms (reflecting the judgments of Federal contract officers) that have won federal prime contracts in the past.

Data on Entities Registered to Compete for Federal Prime Contracts

Firms that wish to compete for Federal prime contracts generally must register as potential contractors. This involves filling out a form on-line using the System for Award Management (SAM) which is operated by the General Services Administration (GSA) of the U.S. Federal government.⁸ Because there is no fee

⁶ NAICS is a hierarchical industry classification system in that as more digits are added to the code, the industry classifications become more narrowly defined and more sparsely populated by firms.

⁷ By “statistically significant” we mean that the relationship is estimated precisely enough that one can say with a degree of confidence that the odds ratio is different from 1 (an odds ratio of 1 implies the odds of WOBs winning contracts is the same as the odds of other firms winning).

⁸ More details about the SAM data are available at www.sam.gov. We define a “firm” as a SAM registrant and use its DUNS number to identify it. A DUNS number is a unique business establishment identifier maintained by Dun & Bradstreet that registrants must obtain in order to register in SAM. Multiple establishments, each with their own DUNS number, can belong to a single parent company (with its own distinct DUNS number). Due to contractual agreements between Dun & Bradstreet and the General Services Administration, we were not able to obtain access to the parent company DUNS numbers. Therefore, we

it is a low-cost way for a firm to self-identify as being interested in competing for Federal contracts. Registration in SAM must be re-certified by the firm each year.

Firms that register in SAM must indicate the industries in which they are able to provide goods or services, using the six-digit North American Industry Classification (NAICS) codes. NAICS is a hierarchical classification system in that as more digits are added to the code, the industry classifications become more narrowly defined – and more sparsely populated. Below we use codes at the four-digit NAICS code level allowing us to have sufficient data in each industry grouping and to take into account the possibility that many firms can switch production of goods or services between the narrower six-digit industry categories encompassed by a four-digit industry category.⁹ Firms can identify themselves as simultaneously operating (or having the potential to operate) in multiple NAICS codes, so when the data are analyzed on an industry basis, entities can appear in the data set multiple times.

The SAM data also include self-reported information from each registrant on its company's size both in terms of numbers of employees and average sales over the past three years. Based on this size information, SAM determines whether the firm is defined by the SBA as "small," which generally is defined as 500 or fewer employees in manufacturing industries and \$7.5 million or less sales revenues in service industries, but there are many exceptions.¹⁰

Since WOBs may also belong to other groups for which the Federal government has specific contracting dollar award goals (which may have impacts one way or another on the likelihood and size of winning contracts), it is important to control for membership in such groups when trying to estimate the odds of various groups winning contracts.

Table 2 summarizes the owner characteristics of WOBs and non-WOBs. As discussed below, the data used in this report contain information on more than 600,000 firms, of which about 20 percent are self-identified as women-owned. Virtually all (94 percent) WOBs are small as defined by SBA compared to 77 percent of non-WOBs. Small WOBs are more likely (52 percent) to report belonging to groups for which the Federal government has contracting goals compared to 38 percent of small non-WOBs.¹¹

We extracted certain data elements from the SAM file, including NAICS codes, business start date, average number of employees, annual receipts, one or more "business types," type of organization (e.g., sole proprietorship, partnership, and corporation) and DUNS numbers. Business types are various categories of entities that registrants report they belong to, and for many business types (e.g., the minority group and gender of the firm owner), registrants can have multiple business types. Business types include government and non-profit entities; whether the registrant is a Small Disadvantaged Business; the race and ethnicity of the registrant; minority-ownership; woman ownership; service-

did our analysis at the establishment level, effectively treating each establishment as if it were independent. Note that we use the terms "firm," "business," "company," and "registrant" interchangeably in this report.

⁹ See <http://www.census.gov/eos/www/naics/> for more details about NAICS. In this report we use the term "four-digit NAICS code" or just "NAICS code" interchangeably with the term "industry" depending on context.

¹⁰ The SBA size standards are summarized at <https://www.sba.gov/content/summary-size-standards-industry-sector> and are described in more detail at <https://www.sba.gov/content/small-business-size-standards>.

¹¹ We included small registrants that self-identified as "minority-owned" but not as Small Disadvantaged Businesses among the registrants we designated as belonging to business groups for which the federal government has contracting goals.

disabled veteran ownership; and other veteran ownership (a full list of business types reported in the SAM data is in Appendix C).¹² Business types identifying 8(a) and HUBZone firms were only available in the 2014 SAM data; SBA provided us with a dataset of 8(a) and HUBZone firms drawn from SBA's Dynamic Small Business Search database that we matched by DUNS number to identify these types of firms in the 2012 and 2013 SAM data.

Registrants with missing or zero annual receipts or employment were dropped because we didn't believe there was a reasonable way to impute their size. Registrants larger than the largest US company in 2014 (Wal-Mart) were dropped as well as registrants older than 300 years (because such data indicated a problem with the data, such as a typographical error when registrants entered the data into the SAM database.)¹³

¹² Business types also identify if the registrant is only interested in grants and not contracts; located outside of the US; a government entity; and/or an international organization. All of the firms of these types were dropped from all datasets used in our analysis.

¹³ The impact on our analysis was immaterial when we dropped the top five percent in sales revenue and employees of the remaining firms.

Table 2: Ownership Characteristics of Women-Owned Businesses

	WOB		non-WOB		All

Percents may not sum to 100% due to rounding.

We combined data from three points of time (October 1, 2012, September 30, 2013, and September 30, 2014) in order to obtain the set of firms that were registered in SAM over the FY2013-14 period. Since registrants may have entered data about themselves more than once during that period, we needed to reconcile differences in data for the same registrant. We did this by choosing the maximum value for continuous variables such as firm size and firm age; and if a registrant belonged to a particular group in either year we designated the registrant as being in that group over the entire period.¹⁴ Many firms were actively registered in SAM over the entire period, but some firms registered for the first time or did not renew their registration, so they were in the sample less than 100 percent of the period. Since one might expect that the probability a firm wins a contract increases the longer the firm is registered in SAM, we created an additional explanatory variable equal to the fraction (greater than zero but less than or equal to one) of the two year period that each firm was registered in SAM.

We also obtained from GSA a list of firms that were excluded from doing business with the federal government (current lists of such firms are also available for public download from www.sam.gov). We matched these firms by DUNS number to the other SAM data sets and dropped from the analysis the very small number of firms (667 or less than 0.1 percent) that were on the exclusions list.

¹⁴ We also performed our analysis using the minimum values for continuous variables and designated group membership if the registrant had reported membership for both fiscal years, and we did not find a material difference between the two methods.

Data on Contractors and Contract Awards

Data on prime contracts with estimated value of \$3,000 or more for goods and services purchased using appropriated funds and awarded by federal Executive Branch agencies generally must be reported in the Federal Procurement Data System (FPDS), which is administered by GSA.¹⁵ These data provide two broad types of information. First, the data include contract action characteristics, such as the agency awarding the contract; the six-digit industry NAICS code of the product or service procured by the agency under the contract action; the dollars obligated (or de-obligated) under the contract action; and the place of performance. Second, the data include contractor characteristics (such as company name and DUNS number). Each record in the FPDS represents a single contract action. For purposes of this report, we define a firm as “winning” a contract in an industry in FY 2013 and FY 2014 if it had at least one newly awarded contract in either year.¹⁶ SBA provided us with data on contract actions from the FPDS that allowed us to focus on the large subset of contracts that are covered by Federal government-wide prime contracting goals (but not necessarily won by firms belonging to groups for which the Federal government has contracting goals).¹⁷

Past Performance Data

We obtained Past Performance Information Retrieval System (PPIRS) data from GSA, which consisted of ten datasets from legacy and current systems with ratings on many different aspects of contractor performance. For each performance rating for each firm, we calculated the median performance rating (unless there was an overall rating available), and then we calculated the median rating for each DUNS

¹⁵ For more details, see the Frequently Asked Questions about the FPDS available at https://www.fpds.gov/wiki/index.php/FPDS-NG_FAQ.

¹⁶ SBA advised us that the way to identify newly awarded contracts in a fiscal year is to (1) identify the first (chronologically) contract action record that had a Procurement Instrument Identifier (PIID) but no Indefinite Delivery Vehicle (IDV) PIID and with Modification Number equal to 0 and (2) extract all additional contract actions associated with same PIID in the IDV PIID field.

¹⁷ The following categories of contracts are not included among contracts for which there are Federal goals:

- Javits-Wagner O'Day Program (JWOD, Sheltered Workshops)
- UNICOR or Federal Prison Industries
- American Institute in Taiwan
- Contracts awarded and performed outside the United States
- Acquisitions by Agencies on behalf of foreign governments or entities or international organizations
- Contracts funded predominately with agency generated sources, including the following government agencies:
 - o FDIC
 - o Postal Service
 - o Bureau of Engraving and Printing
 - o United States Mint
 - o Office of the Comptroller of the Currency
 - o Office of Thrift Supervision
 - o Transportation Security Administration
 - o Federal Aviation Administration
 - o Tennessee Valley Authority
 - o Defense Commissary Agency contracts are excluded because they are buying for resale in a military commissary.
 - o Quasi-government agencies operating with non-tax dollars (known as non-appropriated funds) that were not competed because the products they purchase are being bought to be resold. The money the agency gets from the sale fund the operation of the organization.”

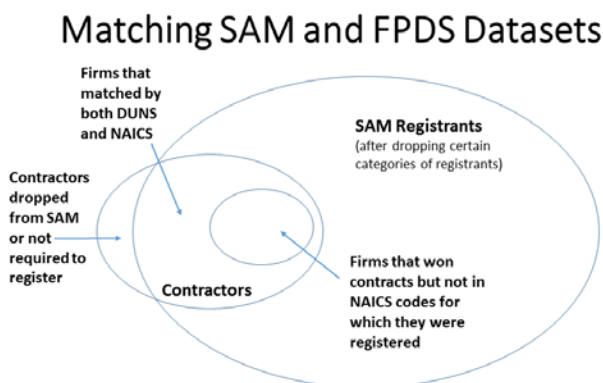

(“Frequently Asked Questions About FPDS-NG” http://www.acquisition.gov/faqs_whataboutfpds.asp#q12)

number. Firms with median ratings of “very good” or “above average” or better were deemed to be “higher rated”; all other firms with past performance ratings were deemed to be “lower rated.”

Analytical Dataset Construction

We merged the SAM and FPDS data sets by DUNS number and NAICS industry code.¹⁸ Figure 2 provides a schematic description of the matching process. Firms were deemed “winners” of contracts if either they matched by both DUNS and NAICS codes or if they won contracts in NAICS codes for which the firm was not registered in SAM; all other DUNS/NAICS code entities were deemed “non-winners.” Past performance data was matched by DUNS number.

Figure 2

Since small firms (as defined by SBA) are one of the groups of firms for which the federal government has contracting goals, we wanted our analysis to control for whether a firm is small. Since SBA has separate definitions for small firms by six-digit NAICS industry codes, and because we were combining two fiscal years’ worth of data, we designated a company as “small” in each four-digit NAICS code if it was small in any of the corresponding six-digit NAICS codes for which it was registered in SAM at any point during FY 2013-14.¹⁹

¹⁸ We dropped several industries as described in the table below:

NAICS Code	Description	Reason Dropped
521X	Monetary Authorities – Central Bank	This industry only consists of one entity – the Federal Reserve System – and no contracts were awarded in this industry.
814X	Private Households	No SBA small business definition.
921X-928X	Public Administration	No SBA small business definition.

¹⁹ As noted above, we also performed our analysis by deeming a registrant as small if it was designated as such in both fiscal years; the difference in results was immaterial.

Summary of Data

In this section we compare the characteristics of women-owned businesses to those of other businesses. As discussed below, women-owned businesses are less likely to win contracts. Furthermore, winners of contracts are larger and older than non-winners, even when focusing only on small businesses. And finally women-owned businesses are smaller and younger than other businesses – characteristics that are associated with the likelihood of winning contracts.

Table 3 shows by group in columns (such as all firms in the first column, WOBs in the second column, etc.) the mean value of the various indicator variables representing various firm characteristics (in rows) included in our analysis. Indicator variables take a value of one (1) if a firm has the characteristic and zero (0) if it does not, so the mean of these variables can be interpreted as the share of firms in each group with each characteristic. The first row shows the number of firms in each column. The second row shows that 21 percent of non-WOBs (column 3) won contracts compared to 17 percent of WOBs (column 2), which is equivalent to WOBs having about 22 percent lower odds of winning contracts before controlling for other factors related to winning contracts (as discussed in the next section of the report).²⁰ About one-third of WOBs are SDBs not in the 8(a) program or minority-owned (or both); non-WOBs are only half as likely to belong to these groups. WOBs are more likely to be sole proprietors than non-WOBs (22 percent vs. 14 percent, respectively) and less likely to be corporations (54 percent compared to 63 percent, respectively).²¹ WOBs are slightly less likely to have higher past performance ratings than non-WOBs.

Columns 4 and 5 of Table 4 compare characteristics of firms that win contracts and those that do not. Winning firms are more likely to belong to some groups for which the Federal government has contracting goals (such as small and 8(a) firms) but less likely to belong to some other groups (WOB, SDB not 8(a), and Minority-owned) than non-winning firms.²² Winning firms are more likely to be corporations and less likely to be sole proprietors or partnerships than non-winning firms.²³ As expected, winning firms are more likely to have security clearances and to have higher past performance ratings than non-winning firms. These patterns hold when looking separately at WOBs (columns 6-7) and non-WOBs (columns 8-9).

²⁰ The odds ratio = $(P_{\text{WOB}} / 1 - P_{\text{WOB}}) \div (P_{\text{Non-WOB}} / 1 - P_{\text{Non-WOB}})$, where P_{WOB} = probability of WOBs winning contracts and $P_{\text{Non-WOB}}$ = probability of Non-WOBs winning contracts. Here $P_{\text{WOB}} = 0.173$ and $P_{\text{Non-WOB}} = 0.211$ and the resulting odds ratio is 0.783.

²¹ About 14 percent of non-WOB corporations and about seven percent of WOB corporations self-identified as “non-profit.”

²² In Table 3, firms can belong to one or more of these groups: WOB; Small; SDB not 8(a); 8(a); Minority; HubZone; Service-Disabled Veteran; and Other Veteran. However, firms can only belong to one type of organization: Sole Proprietor, Partnership, Corporation, or Other (not shown); one level of security clearance (the “no security clearance” category is not shown), and one level of past performance rating (the “no rating” category is not shown).

²³ About seven percent of corporations winning contracts were non-profit compared to 14 percent of non-winning corporations; only three percent of WOB corporations that won contracts were non-profits compared to seven percent of non-WOB corporations winning contracts.

Table 3: Mean Values of Indicator Variables

						WOB		Non-WOB	
	All	WOB	Non-WOB	Winner	Non-Winner	Winner	Non-Winner	Winner	Non-Winner
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
N	601,025	117,249	483,776	122,179	478,846	20,328	96,921	101,851	381,925

Table 4 compares the distribution of continuous variables (which take values that range widely across firms), that is, it shows the values each variable takes at various percentiles for that variable. (For example, the 10th percentile age for all firms is 3 years, which means that 10 percent of firms are age 3 years or less; the median age, also known as the 50th percentile, is 14, which means half of firms are age 14 years or less.) Table 4 shows that WOBs are considerably smaller and younger than non-WOBs. The median annual revenues for WOBs is \$250,000, which is one-quarter that of non-WOBs (\$1 million), and the median number of WOB employees is one-third that of non-WOBs (three and nine, respectively). The median age of WOBs is 11 years compared to 15 for non-WOBs. At the median, WOBs and non-WOBs were both actively registered in SAM about one-half of the FY 2013-2014 period.

Table 4 also shows that contract winners are larger and older than non-winners. Contract winners' median annual revenues is about \$2.1 million, more than triple that of non-winners (\$0.6 million). Winners have more than double the median number of employees as non-winners (13 and 6, respectively), and the median age of winners is 18 years compared to 14 years for non-winners. Focusing only on WOBs, winning firms have quadruple the median revenues of non-winning WOBs (\$0.8 million compared to \$0.2 million); double the median number of employees (six compared to three); and have median age of 14 years compared to 10 years of age for non-winners. At the median, winners were actively registered over the entire FY 2013-2014 period compared to non-winners, which were actively registered for only half that period; this makes sense (all else equal, one would expect that the longer a firm is actively registered in SAM the greater its chances for winning contracts).

Finally, among firms that won contracts, WOBs and non-WOBs have very similar distributions of numbers of contracts and contract dollars awarded. Within each group, the median firm has two

contracts; the median dollars awarded was \$24,000 for WOBs, only 8 percent lower than the corresponding value for non-WOB winners.²⁴

Table 4: Distribution of Continuous Variables

Variable	Group	10th Percentile	25th Percentile	Median	75th Percentile	90th Percentile
Age	All	3	7	14	28	45
	WOB	3	5	11	20	31

Sales Revenue	All	\$5,000	\$100,000	\$800,000	\$5,000,000	\$54,000,000
	WOB	\$300	\$32,000	\$250,000	\$1,259,462	\$4,800,000
	Non-WOB	\$10,000	\$140,000	\$1,000,000	\$7,500,000	\$104,000,000
	Winner	\$30,000	\$300,000	\$2,055,900	\$11,900,000	\$121,000,000
	Non-Winner	\$2,500	\$80,000	\$600,000	\$4,000,000	\$40,000,000
	WOB Winner	\$10,000	\$100,000	\$800,000	\$3,010,193	\$10,000,000
	WOB Non-Winner	\$100	\$25,000	\$200,000	\$1,000,000	\$3,750,000
	Non-WOB Winner	\$40,000	\$400,000	\$2,750,000	\$15,300,000	\$212,000,000
	Non-WOB Non-Winner	\$5,000	\$100,000	\$850,000	\$5,900,000	\$84,900,000
Share of FY 2013-2014 in Sample	All	0.197	0.327	0.519	1.000	1.000
	WOB	0.193	0.321	0.515	1.000	1.000
	Non-WOB	0.197	0.329	0.519	1.000	1.000
	Winner	0.500	0.867	1.000	1.000	1.000
	Non-Winner	0.184	0.282	0.500	1.000	1.000
	WOB Winner	0.500	0.955	1.000	1.000	1.000
	WOB Non-Winner	0.181	0.281	0.500	1.000	1.000
	Non-WOB Winner	0.500	0.849	1.000	1.000	1.000
	Non-WOB Non-Winner	0.184	0.284	0.500	1.000	1.000
Number of Contracts	Winner	1	1	2	4	10
	WOB Winner	1	1	2	3	9
	Non-WOB Winner	1	1	2	4	10
Dollars Awarded	Winner	\$2,410	\$7,184	\$25,646	\$133,925	\$824,913
	WOB Winner	\$1,470	\$6,583	\$24,000	\$115,312	\$687,541
	Non-WOB Winner	\$2,501	\$7,300	\$26,157	\$137,957	\$857,644

²⁴ Note that dollars awarded and numbers of contracts reported in Table 4 are for contracts won in FY 2013 or FY 2014 and do not necessarily correspond to the total dollars awarded over the lifetimes of these contracts.

Regression Model Specification and Results

Regression Approach

The main question of interest here is whether the data show any difference in the odds that WOBs would win contracts relative to other businesses holding constant other factors that may influence the likelihood of winning a contract. Regression analysis is a tool used by economists to address this type of question. We start with a hypothesis about the relationship between a variable to be explained (the “dependent” variable) and one or more explanatory (“independent”) variables and estimate whether these variables are associated with each other in a way that is consistent with the hypothesis. There are many types of regression analyses, but the logit model²⁵ is widely used to analyze the odds of an event occurring, such as a firm being awarded a contract, and it is this type of model that is used in the analysis described here to address the main question of interest. The standard way to represent this model is:

$$Y = \exp(\beta * X + \epsilon) \quad (1)$$

In this example, Y, the dependent variable, is equal to the odds of winning a contract, X is one or more independent variables that influence the odds of whether or not a given firm wins a contract, and $\exp(.)$ is the exponentiation function.²⁶ The Greek letter beta (β) is an unknown parameter or set of parameters that is to be estimated and gives the degree to which an independent variable is related to a dependent variable. The final term in the equation, represented by the Greek letter epsilon (ϵ), is known as the error term and represents the other elements that might influence the dependent variable but which are not explicitly included in the estimation. The error term “arises for several reasons, primarily because we cannot hope to capture every influence on an economic variable in a model, no matter how elaborate.”²⁷

A key feature of a regression is that it allows the researcher to isolate the effects of one independent variable on the dependent variable separately from the other independent variables. In other words, the first β that is estimated in an equation represents the relationship between Y and the first X variable *holding constant* all the other independent variables. As an example, regression analysis could be used to examine how characteristics of a home affect its sales price. To do this, one might hypothesize that the value of a home depends on factors such as the number of bedrooms in a house, the number of bathrooms and the size of the lot on which the house is found. Then, the β that is associated with the number of bedrooms is a measure of how increasing the number of bedrooms affects the sales price holding constant the number of bathrooms and the size of the lot.

²⁵ We used a variant of the logit model called the Firth method that adjusts for possible estimation biases for industries that have a very low contract win rate and in cases where winning or not winning a contract is perfectly or nearly perfectly equal to a linear function of one of the control variables (for example, in industries where no WOBs won any contracts). (See Firth, D. 1993, “Bias reduction of maximum likelihood estimates,” *Biometrika* 80:27-38; Heinze, G. and Schemper, M. 2002, “A solution to the problem of separation in logistic regression,” *Statistics in Medicine* 21:2409-19. We used the firthlogit Stata module written by Joseph Coveney to make these estimates (<http://econpapers.repec.org/software/bocbocode/s456948.htm>).

²⁶ In other words, the model is represented by $Y = \exp(\beta * X + \epsilon)$, where $\exp(\beta * X + \epsilon) = e^{\beta * X + \epsilon}$ and e is approximately equal to 2.718, the base of the natural logarithm.

²⁷ Greene, William H., *Econometric Analysis*, Sixth Edition, Pearson Education, 2008 at p. 9.

Another key to estimating regressions successfully and to draw the proper inferences from the results is to make sure that the appropriate variables are included in the model. For example, it may often be the case that a house with more bedrooms is also likely to have more bathrooms. If a regression of housing prices only includes the number of bedrooms it may overstate the influence of this variable on prices as the estimate of the β associated with the number of bedrooms also will include the influence of the number of bathrooms on prices.

In the logit model used in this report, $\exp(\beta)$ is called the “odds ratio” associated with an independent variable, and it indicates the odds of winning a contract associated with the presence of the corresponding independent variable relative to the odds of winning in the absence of that variable. Of special interest in this report, the odds ratio associated with the variable indicating whether a firm is woman-owned is interpreted as the odds of a women-owned business winning a contract relative to businesses not owned by women.

When estimating this model, as with the housing example discussed above, it is important to include other variables that might also influence whether a WOB wins a contract or not. For example, it might be the case that newer firms are less likely to win contracts, on average, than older firms. Thus, it would be important to include a measure of the age of the firm in the model to control for this fact. This is particularly important given that women-owned firms are more likely to be younger than other firms; in this situation, if the age of the firm is not included in the model, one might conclude that the odds of WOBs winning contracts is lower, on average, when, in fact, it is the odds of younger firms winning contracts that is lower.²⁸

Here, the independent variables we use are the ownership of the firm (minority-owned, women-owned, and veteran-owned); the type of organization (that is, whether the firm is a corporation, a partnership or some other type); other characteristics of the firm (size, in terms of number of employees and revenues, level of security clearance of the firm, age of the firm, the proportion of time the firm was in the sample during FY13-14, and past performance ratings on recent contracts won by the firm); and whether the firm is small according to the SBA definition.

Table 5 lists estimates of the “odds ratios” of the independent variables described above, holding the other variables constant. Not surprisingly, we see a positive and significant increase in the odds of a firm winning a contract as the age of the firm and the size of the firm, measured either by sales or number of employees, increases. Firms with various levels of security clearance also had higher odds of winning contracts than firms that did not report having a security clearance level, with the largest effect resulting for those firms with “secret” clearance. Ownership structure can also influence the odds of a small firm winning a contract, with the odds of partnerships winning contracts being lower and the odds of sole proprietorships and corporations winning being higher than other forms of organization, holding all other factors constant. And as expected, firms with higher past performance ratings are more likely to win contracts than those with lower (or no) ratings, and the greater the proportion of time a firm was actively registered in SAM, the more likely it is to win contracts.

²⁸ Why WOBs are younger or smaller is not part of what was studied in this report.

The main variable of interest, however, is whether the business is woman-owned (at the top of the table). Controlling for other factors, the odds of WOBs winning contracts were lower than otherwise similar non-WOBs; specifically, the odds of a WOB winning a contract is roughly 21 percent lower than other types of businesses.

Perhaps unsurprisingly, firms that participate in SBA's 8(a) business development program, a program in which firms are awarded contracts through restricted competitions or on a sole-source basis, had odds of winning contracts that were many times higher relative to the odds of winning contracts by other small businesses. Similarly, other types of firms that the federal government allows to participate in sheltered competition programs in prime contracting, such as those owned by service-disabled veterans or those located in Historically Underutilized Business Zones (HUBZones), also appear to have increased odds of winning contracts relative to the odds of firms without such characteristics.

These relationships, as in all regression models, are estimated with some degree of error. Thus, it is common practice to estimate whether the measured relationship is "statistically significant"; that is, given this degree of error, it is possible to distinguish the estimate from some fixed value (usually zero) with a high degree of certainty or whether it is just chance that makes the estimate different from this fixed value. With odds ratios, the estimate is statistically significant if it can be distinguished, with a high degree of certainty, from one (1.0), the point where the odds of the two groups compared (e.g. WOBs and non-WOBs) are the same (or to put it another way, otherwise similar members of the two groups are equally likely, on average, to win contracts). If we cannot distinguish the estimate from one with enough certainty, then we cannot say that the odds of winning a contract for one group are different than the odds of another group winning a contract.

Whether an estimate of a statistical relationship between two variables is significant is a function of two things – how close the estimate is to the value that would indicate no relationship (or, in this case, that represents the odds of winning being equal for two groups) and how precisely we can estimate this relationship. One of the key factors in the degree of precision is the number of observations we have to estimate our model; generally, the more observations, the more precise is the estimate.²⁹ The measures of precision are represented by the "standard errors" of the estimates, which in Table 4 are the numbers in parentheses below the estimates of the odds ratios.

Typically, when assessing statistical significance, we look at roughly two standard errors above and two standard errors below the relevant estimate to determine the range within which we are confident the true estimate lies (also known as the confidence interval). If 1.0 is in the confidence interval, then the hypothesis of the odds of winning a contract between two groups being the same cannot be rejected.

For the estimate of the WOB odds ratio in the full sample (shown in Table 5), the standard error is estimated to be 0.00767 so we are confident that the true value lies somewhere between 0.771 and 0.801 (0.786 plus or minus two times 0.00767). Therefore, we can say that the estimate of the odds of an WOSB winning a contract is significantly less than one (i.e. the fact that the odds of an WOSB firm winning a contract is estimated to be lower than odds for other firms is not due to chance.)

Table 6 provides a summary of the results when the same model is estimated separately for each four-digit NAICS code. Appendix A provides a more detailed list of the industry-by-industry odds ratio

²⁹ To illustrate this point, if you flipped a coin 10 times and got 7 heads, you might think the coin is biased, but the number of observations prevent you from drawing that conclusion with certainty. If you flip the same coin 10,000 times and get heads 7,000 times, you can conclude that it is highly likely that the coin is biased.

estimates for WOBs and other industry-level data. Appendix B provides the full set of regression results. The industry-specific results on the odds of winning contracts vary considerably.

We find in Table 6 that in 109 industries (36 percent of the total) WOBs have statistically significant lower odds of winning contracts, covering 62 percent of contracts and nearly two-thirds of dollars obligated. In an additional 145 (48 percent) of the 304 industries included in our study the odds of WOBs winning contracts were lower than those of otherwise similar non-WOBs but in these cases there is not a statistically significant difference between the odds of winning contracts for the two groups. On the other hand, WOBs have greater odds of winning contracts in 50 industries (about 16 percent) than otherwise similar non-WOBs accounting for the same share of contracts and about 15 percent of dollars awarded; in none of these industries are the higher odds statistically significant.

Table 6: Summary of Findings on Likelihood of WOBs Winning Contracts

	Contracts		Awards		Industries	
	Number	Percent	\$millions	Percent	Number	Percent
Odds ratio less than 0.40 and statistically significant	2,813	0.3	\$442	0.3	8	2.6
Odds ratio 0.40-0.49 and statistically significant	20,577	2.2	\$2,079	1.5	13	4.3
Odds ratio 0.50-0.59 and statistically significant	106,672	11.5	\$4,150	2.9	21	6.9
Odds ratio 0.60-0.69 and statistically significant	88,164	9.5	\$26,085	18.4	27	8.9
Odds ratio 0.70-0.79 and statistically significant	160,809	17.3	\$23,831	16.8	30	9.9
Odds ratio 0.80-0.89 and statistically significant	197,691	21.2	\$35,813	25.3	10	3.3
Odds ratio 0.90-0.99 and statistically significant	0	0.0	\$0	0.0	0	0.0
Subtotal: Odds ratio less than 1.0 and statistically significant	576,726	62.0	\$92,400	65.3	109	35.9
Odds ratio less than 1.0 and not statistically significant	208,341	22.4	\$28,529	20.2	145	47.7
Odds ratio 1.0 or greater and not statistically significant	145,456	15.6	\$20,637	14.6	50	16.4
Odds ratio 1.0 or greater and statistically significant	0	0.0	\$0	0.0	0	0.0
Total	930,523	100.0	\$141,567	100.0	304	100.0
<i>Memo Subtotal: Odds ratio less than 1.0</i>	<i>785,067</i>	<i>84.4</i>	<i>120,930</i>	<i>85.4</i>	<i>254</i>	<i>83.6</i>

Percents may not sum to 100% due to rounding. Numbers of contracts and dollars awarded are for contracts that began in FY 2013 or FY 2014.

As mentioned above, how close the estimate of the odds ratio is to one and the sizes of the standard errors (which, in turn, depend largely on the number of observations used in a regression) are the key factors in determining the statistical significance of these ratios. Given the relatively large number of observations we have, the standard errors in Table 5 are all small relative to the size of the estimated odds ratios and, thus, all of the estimated odds ratios are statistically significant. In contrast, estimated odds ratios on an industry by industry basis are not statistically significant if they are estimated to be close to one or with very large standard errors. For example, in Appendix B, the WOB odds ratio in NAICS industry 1133 (Logging) is 0.935, which is relatively close to one and it is estimated with a relatively large standard error (0.320) thus rendering it statistically insignificant; the high standard error reflects at least in part the fact that the Federal government does relatively little contracting with firms in the logging industry.

Comparison of DOC's Methodology to the RAND Corporation Report Methodology

Table 7 summarizes the major differences between our methodology and that used by the RAND report, including an explanation about why we did some things differently.³⁰

Table 7: Comparison of RAND and DOC Methodologies			
Item	RAND approach	DOC approach	Why DOC took a different approach
Time period covered by analysis	FPDS: FY 2005 SAM: 2006*	FPDS: FY 2013-2014 SAM: FY 2013-2014	We used two years' worth of data for two reasons. First, we believe it is necessary to smooth out year-to-year differences in contracting activity and avoid our findings being driven by idiosyncratic activity in one year (e.g., variations in acquisitions by industry). Second, we wanted to have enough data to measure contracting disparities more precisely given our previous experience using one years' worth of data to estimate disparities at the three-digit NAICS industry group level.
Disparity measurement method	Disparity ratios	Logistic regression	We chose to use logistic regression, a very widely used statistical method, so that we could control for firm characteristics associated with winning contracts other than whether a firm was a WOB. This allows us to avoid confounding effects on the odds of winning a contract due to, for example, firm age and size. The disparity ratio method used by RAND did not control for other factors related to winning contracts.
Linked FPDS and SAM data?	No	Yes	We did this in order to use regression analysis to control for firm characteristics other than WOB status. We believe linking the two data sets is generally much more informative about contracting outcomes than using unlinked data.
Method of assessing statistical precision	Power analysis	Statistical significance	We reviewed the statistics and economics literature on "retrospective" or "post hoc" power analysis of the kind RAND performed. Power analysis is appropriate in experimental work to prospectively determine the minimum size sample needed to attain a minimum degree of certainty about measuring the magnitude of a hypothesized effect. Much of the literature cautions against retrospective power analyses in non-experimental conditions (where there is no control over sample size) because it provides no additional information than statistical significance tests. ³¹

*RAND actually used data from the Central Contracting Registry which was a predecessor to the SAM database.

Conclusion

We have also shown that women-owned businesses are less likely to win contracts. Furthermore, women-owned businesses are smaller and younger than other businesses, but this fact account for only part of the disparity in the likelihood of winning contracts; even when controlling for firm characteristics, including firm size and age, women-owned businesses are less likely to win contracts than otherwise similar businesses not owned by women. We find that in 109 industries (36 percent of

³⁰ Nothing in this section of our report should be construed as being critical or disparaging of the RAND report.

³¹ See, for example, John M. Hoenig and Dennis M. Heisey, "The Abuse of Power: The Pervasive Fallacy of Power Calculations for Data Analysis." *The American Statistician*. 55(1) February 2001, pp. 1-6 (available at http://www.tc.umn.edu/~alonso/Hoenig_AmericanStat_2001.pdf).

the total) WOBs have statistically significant lower odds of winning contracts, covering 62 percent of contracts and nearly two-thirds of dollars obligated under contracts awarded in FY 2013 or 2014. In an additional 145 (48 percent) of the 304 industries included in our study the odds of WOBs winning contracts were lower than those of otherwise similar non-WOBs but in these cases there is not a statistically significant difference between the odds of winning contracts for the two groups. Overall, the industries in which WOBs are less likely to win contracts account for about 85 percent of contracts and of dollars obligated in Fiscal Years 2013-2014 (which is the period in which our data originated). WOBs have *greater* odds (none statistically significant) of winning contracts than otherwise similar non-WOBs in only 16 percent of industries.

Appendix A

Sorted By

NAICS Code
